Introduction

- Explosion of IoT devices in smart homes, healthcare, critical infrastructure
- Resource constraints & lack of built-in security
- IoT as attractive targets for large-scale DDoS attacks

- Evaluate Moving Target Defence (MTD) for IoT security
- Integrate MTD with Software-Defined Networking (SDN)
- Evaluate the solution in a public network

- Mutable Networks (MUTE) – crypto-shuffled IP/port mapping
- Random Host Mutation (RHM) – edge IP shuffling
- OF-RHM (OpenFlow) – SDN-based randomization

Proposed Architecture

- Botnet-driven volumetric DDoS (SYN/UDP flooding)
- Target: resource-constrained IoT devices (no IDS/ACL)
